Bullet Charts

Bullet charts are a variation of a bar chart developed by Stephen Few to replace gauges and meters. The Bullet chart has the following advantages over the gauges.

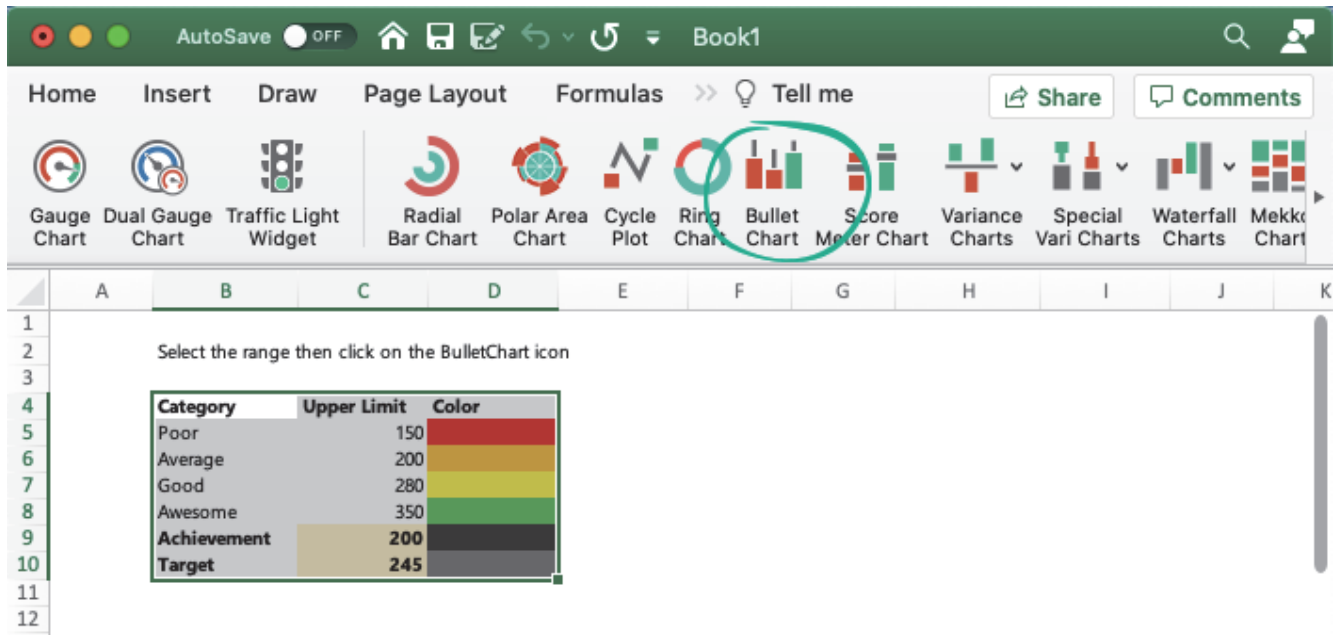

- Space saver – require less real estate, can be oriented horizontally and vertically based on the space available.
- Display multiple measures
- Easier to read and more informative

Example: A Retail company, trying to view their Sales for this quarter. With a bullet chart, one can easily visualize sales progress by comparing the Actual sales vs. Target.

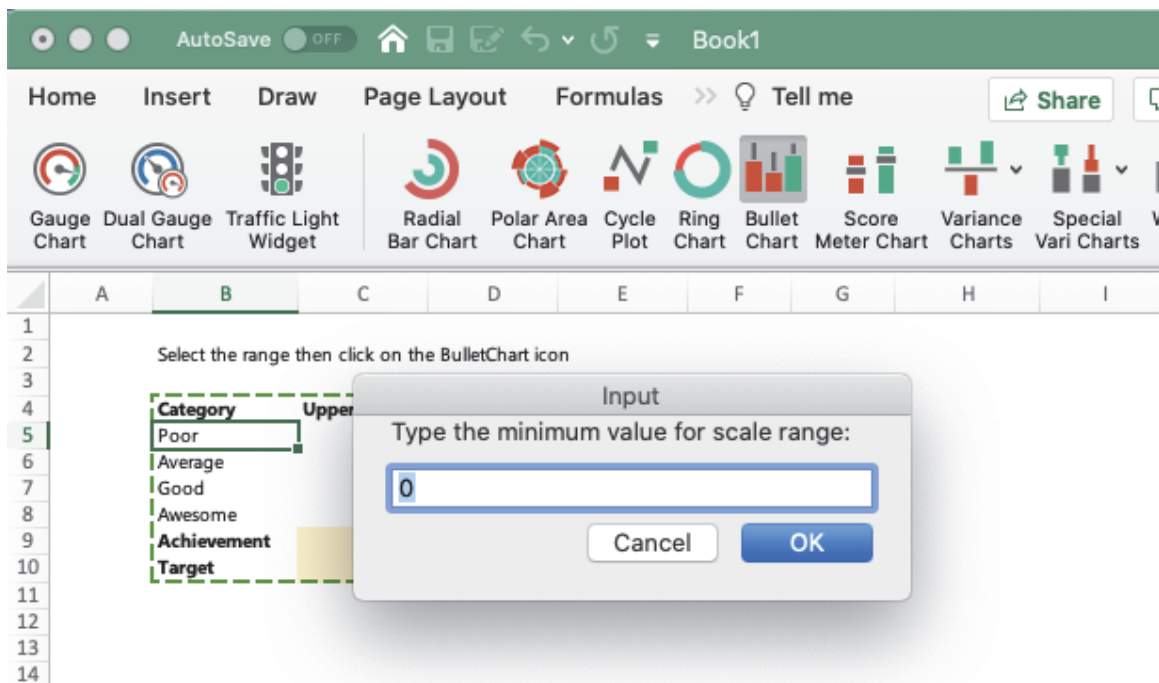

How to create a new Bullet chart?

Select the range which contains Names, Values, and Colors (3 columns)

Click on the Bullet chart icon on the Ribbon.

Add the minimum value (Default = 0)

Click OK to create a chart. You can change the values in real-time.
